

SevaLens

NPU-powered offline document assistant for
Snapdragon® PCs

100% on-device

No uploads, no internet

Native ARM64

No x86 emulation

EN • HI • UR • TE

Four languages

Service shops retype the same data all day

Every application, from scholarships to certificates, needs the same ID details typed in by hand. Documents arrive as photos and scans in several languages, and cloud tools mean sending citizens' most sensitive papers off the shop's own laptop.

1

Repetitive

Same name, DOB and address keyed into form after form

2

Multilingual

English, Hindi, Urdu and Telugu on one desk

3

Sensitive

ID scans should not need to leave the machine

Scan, read, fill: all offline

1

Capture

Scan or photograph an ID, certificate or form

2

Read

OCR on the NPU reads English, Hindi, Urdu, Telugu

3

Extract

Name, DOB, ID number structured and validated

4

Autofill

Values fill the target form; operator confirms

Illustrative UI mock-up

Scanned ID (sample)

Name

A. Sample Name

Date of birth

01-01-1990

ID number

XXXX XXXX 1234

Language

Hindi

Designed around three platform constraints

Sustained thermals

Thin laptops have limited heat headroom under long CPU loads

Run OCR and extraction on the NPU with quantized models; the CPU stays near idle

x86 emulation overhead

Translated x86/x64 apps pay a latency and battery cost

Native ARM64 Python and ONNX Runtime with QNN; no emulated dependencies

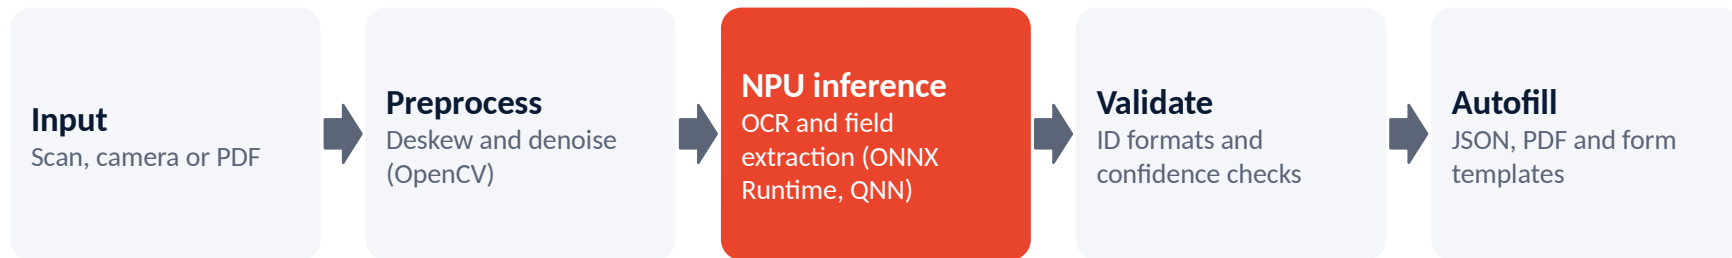

Peak-power spikes

High-clock CPU bursts drain battery even on short tasks

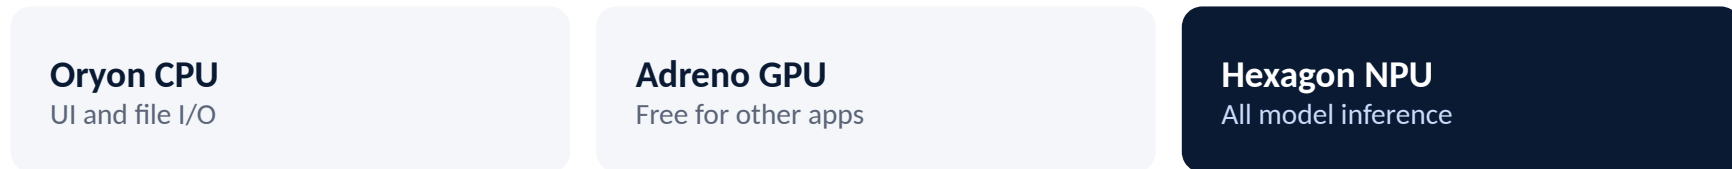

Batch pages onto the NPU; keep CPU work to light I/O and the UI

Everything local, inference on the NPU

Snapdragon® X-series PC

Local encrypted storage · No network calls · Native ARM64 build

Performance targets and validation plan

Metric	Design target	Status	How it will be measured
Latency per page	1 s or less	To validate	50-page sample, end to end
NPU share of inference	90% or more of ops	To validate	QNN execution provider profile
CPU load during inference	Under 15%	To validate	Windows performance counters
Throttling over 10 min	None expected	To validate	Continuous run, clock trace
OCR character error rate	5% or less	To validate	Test set of ID scans

These are design targets, not measured results. Validation will use Qualcomm AI Hub profiling and on-device runs.

Why it matters

Private by design

Citizen documents never leave the laptop

Made for Indian users

English, Hindi, Urdu and Telugu

Easy to deploy

One ARM64 install, works without internet

Built to extend

More form templates and voice input next

Built from real eSeva shop workflows in Hyderabad.
